Expected release date: Tuesday 6 August 2019

A sharp rebound

ANZ Australian Job Ads bounced back in June after falling more than 8% in May. The 'Holiday-year effect' in late April and the timing of the election appear to have been responsible for much of the decline in May, and the rebound in June can be seen as an unwinding of that effect.

In seasonally adjusted terms, job ads gained 4.6% m/m but fell by 9.1% y/y. In trend terms, job ads fell 1.4% m/m and 11.1% y/y.

	Sea	sonally adjus	Trend		
	Number	% m/m	% y/y	% m/m	% y/y
Total job ads	159,717	4.6	-9.1	-1.4	-11.1

See page 4 for technical details

ANZ's Head of Australian Economics, David Plank, commented:

"Job ads in June jumped 4.6%, reversing a bit more than half of the sharp drop in May. The gain was one of the biggest in 18 months. We don't think it necessarily represents a turn in the overall downward trend, however. Job ads plunged more than 8% in May as a result of the timing of the election and the late April 'holiday year' effect (when Easter and ANZAC Day were close together). The subsequent jump in job ads in June represents only a partial recovery from that weakness, suggesting that the overall trend is still downwards. This points to slowing employment growth and rising unemployment. If confirmed by the actual employment data, then the RBA will likely react by lowering the cash rate yet again."

Job Ads jumps by 4.6%

The internet series counts the average number of job ads carried by each of the sites contributing to the series on the same day of each week in the month indicated. The day (which is not necessarily the same for each site) is selected by the site operator as broadly representative of its activity levels.

The data are based on information provided by the operators of the following sites: Seek.com.au, and the Department of Employment's Australian JobSearch site (Jobsearch.gov.au).

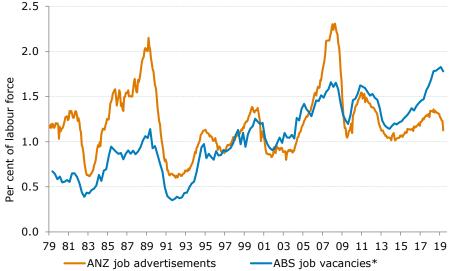

- (a) Concurrent seasonal adjustment method (see Technical Appendix for further details).
- (b) The trend estimates came from applying a 13-term Henderson moving average to the seasonally adjusted series. This smoothing technique enables estimates to be produced for the latest month, but it also results in revisions to the most recent six months as additional observations become available.
- (c) Annual changes are on a year-average basis.

The ANZ Job Advertisements series uses a concurrent seasonal adjustment methodology to derive the seasonal adjustment factors. This means that data from the current month are used in estimating seasonal factors for the current and previous months. Concurrent seasonal adjustment replaced the forward factor methodology from the June 2010 reference month.

The concurrent adjustment methodology uses the most recent data every month, whereas the forward factor approach used it only once a year. Under concurrent adjustment, the seasonal factors will also be more responsive to underlying dynamic changes than forward factors.

Concurrent adjustment can result in revisions to the seasonal factors each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the seasonal adjustment factors for the current month, the previous month and the same month a year ago.

The concurrent seasonal adjustment brings the ANZ Job Advertisements series in line with the methodology used by the ABS for its monthly employment data.

State and territory charts have been discontinued.

Note for editors

For some of the newspapers surveyed, the ANZ Job Advertisements series counts the number of advertisement 'bookings'. Each booking may contain multiple advertisements. In addition, the series counts classified advertisements only, and does not include display advertisements. For these reasons, it would be incorrect to draw any inference or correlation from the ANZ Job Advertisements series regarding advertising volumes or revenues from employment advertising in the newspapers surveyed. The series is not intended as and should not be used as a tool to assess the financial performance of any of the newspapers it draws information from.
